

These researchers are all working together to try and understand how the lungs of babies and young children grow and develop. The main aim of the research is to understand how asthma develops in children. The team want to find out why some children get asthma and others don't. They want to know what happens to the cells that line the airways as children develop. They want to learn about the role of the bacteria in our lungs. And they want to understand how allergens such as dust mites or pollen might trigger asthma.
