

Lindsey, Belfast

“My job in Breathing Together is to do experiments in the lab. The research nurses send us the samples that they collect and I grow the cells so that they multiply lots of times, giving us plenty for our experiments. Most of my days begin with feeding the cells - they are always hungry! As well as doing experiments, I also spend a lot of time reading work by other scientists to get ideas and to see what has already been done. I love my job because the idea of being the first person in the world to do an experiment and discover something new is so exciting. Four people in my family have asthma so this research is really important to me.”
